

ABSTRACT

There is provided heterocyclic compounds of the following formula (I):

in which,

A is optionally substituted alkyl group, optionally substituted aryl group or optionally substituted heterocyclic group;

B^1 and B^2 are, hydrogen atom, alkyl group or hydroxyl group; or combined together to represent carbonyl group;

X is oxygen atom, sulfur atom, carbon atom or nitrogen atom;

dotted line shows either presence or absence of bond;

n is integer of 1 or 2; and

the group -X-Y- represents optionally substituted alkylene or cyclic alkenylene bond;

or a pharmaceutically acceptable salt thereof.

These compounds have good affinity for $\alpha 4\beta 2$ nicotinic acetylcholine receptors and activate the same to thereby exert a preventive or therapeutic effect on cerebral dysfunction.
